

Biodiversity responses to predator control

Rachelle Binny, Andrea Byrom, John Innes,
Roger Pech and Alex James

SONZ Workshop
Banks Peninsula, 8 August 2017

LANDCARE RESEARCH
MANAAKI WHENUA

Overview

- What are the effect sizes of biodiversity responses to predator control?
- Aims:
 - Compare biodiversity outcomes from different control regimes
 - Consider community-level responses (e.g. trends in diversity indices)
- Approaches:
 - Meta-analysis of outcome literature
 - Modelling biodiversity monitoring data, aggregated across multiple sites

Major control regimes

Regime	Outcome objective	Sites	Mammals targeted	Mammal control objective	Control method
1	Ecosystem restoration – maximise indigenous dominance	Marine and lacustrine islands, ring-fenced sanctuaries	All (up to 14 species)	Eradicate all species	Aerial or ground application of brodifacoum, plus follow-up trapping, hunting, poisoning.
2	Ecosystem restoration – increase indigenous dominance	Peninsula-fenced sanctuaries, mainland islands	Typically possums, stoats, ship rats plus some of cats, ferrets, weasels, Norway rats, and hedgehogs	Sustained (sometimes seasonal) control of several key pest species	Initial or repeated (2-7 years) aerial poisoning with 1080, and/or sustained (usually annual) ground poisoning and trapping
3	Tb vector control	Forest and pastoral landscapes	Possums, ferrets, deer	Sustained or pulsed low numbers of target taxa	Aerial 1080 poisoning each 4-5 years, plus diverse ground poisoning and trapping

Major control regimes

- Ring-fenced sanctuaries:
 - Restore ecosystems, maximise indigenous dominance
 - Eradication of all pest mammals
 - Reintroductions of threatened species
- Mainland islands (DOC and SONZ)
 - Restore ecosystems, increase indigenous dominance
 - Intensive, sustained control of key pests
 - Monitoring using standardised methods/measures

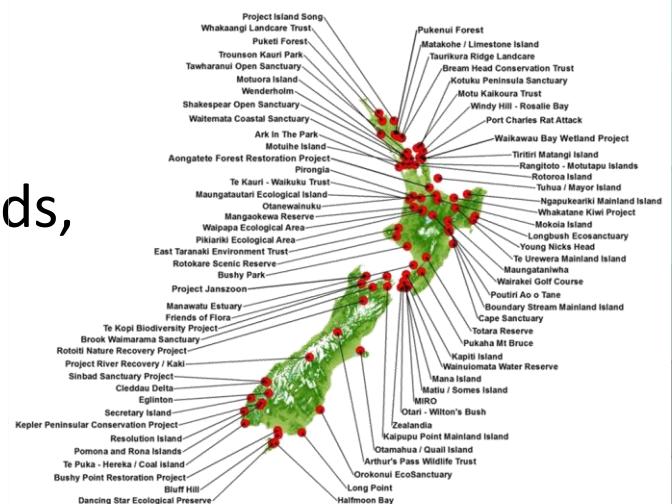

Key questions

1. How does indigenous biodiversity respond to pest control?
2. What are the ecological community-level responses to changes in pest abundance due to control?
3. How do responses differ among habitat types?
4. What are the time lags between changes in pest abundance and biodiversity response?

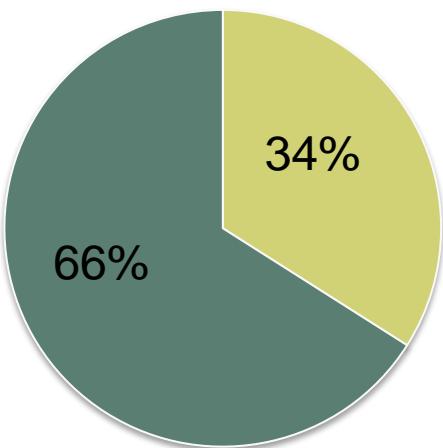

Biodiversity monitoring database

- Database of biodiversity monitoring data from managed sites
- 782,322 records
- 21 sites (18 sanctuaries, 3 DOC Mainland Islands)
- 17 unfenced, 4 fenced
- 1995-2016
- 438 species (birds, invertebrates, lizards, vegetation and pests)

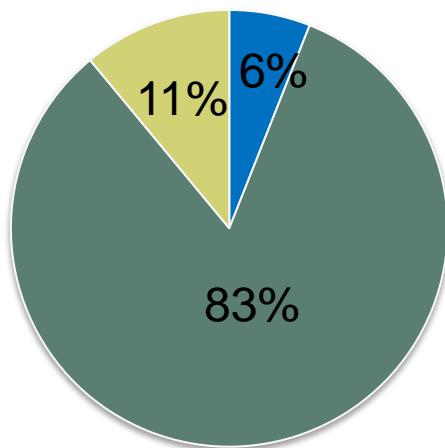

Biodiversity monitoring database

Habitat

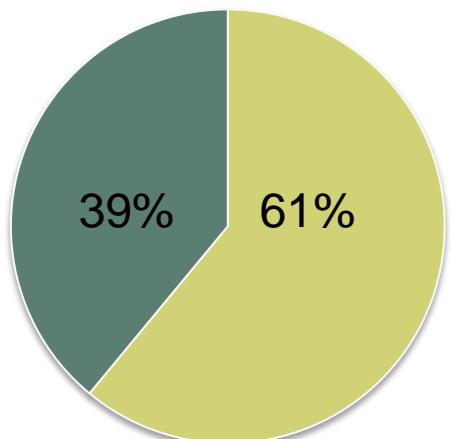

■ Beech
■ Podocarp-broadleaved

Site Type

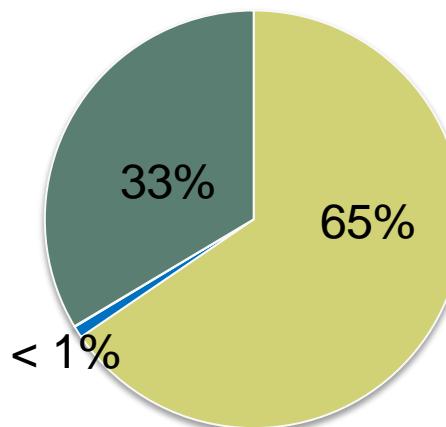

■ Fenced
■ Mainland Island
■ Unfenced

Treatment type

■ Treatment
■ Non-treatment

Taxa

■ Birds
■ Invertebrates
■ Lizards
■ Vegetation

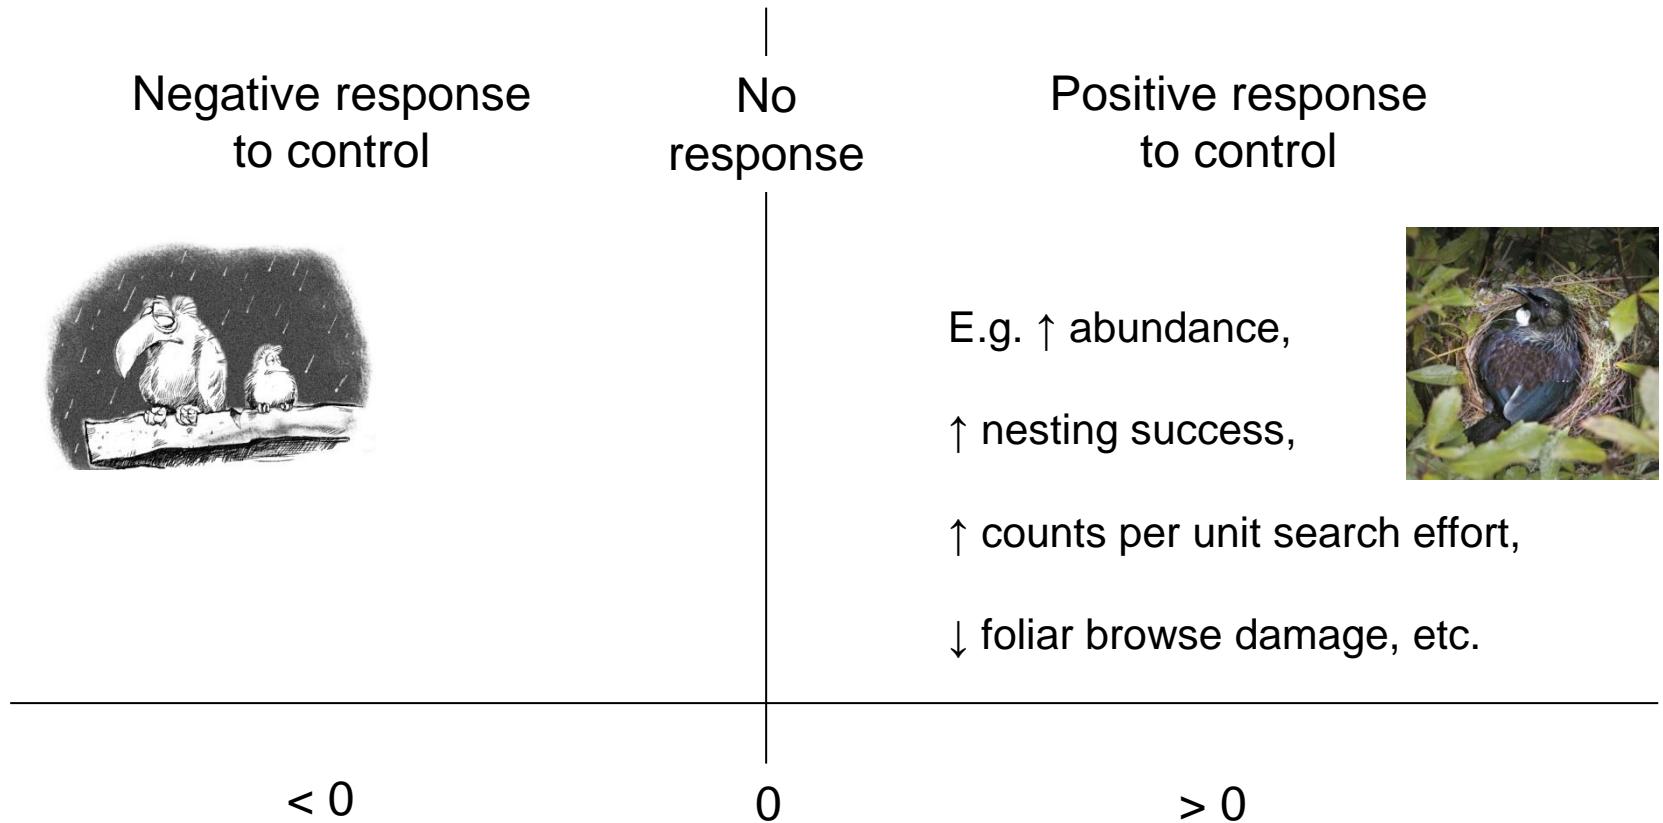

Room for improvement?

- Standardised monitoring methods and measures ✓
- Data sharing & reuse: discoverability, accessibility, ownership
- Data management: cleaning, databases, maintenance, curation
- New models for combining diverse monitoring data at different spatial and temporal scales.

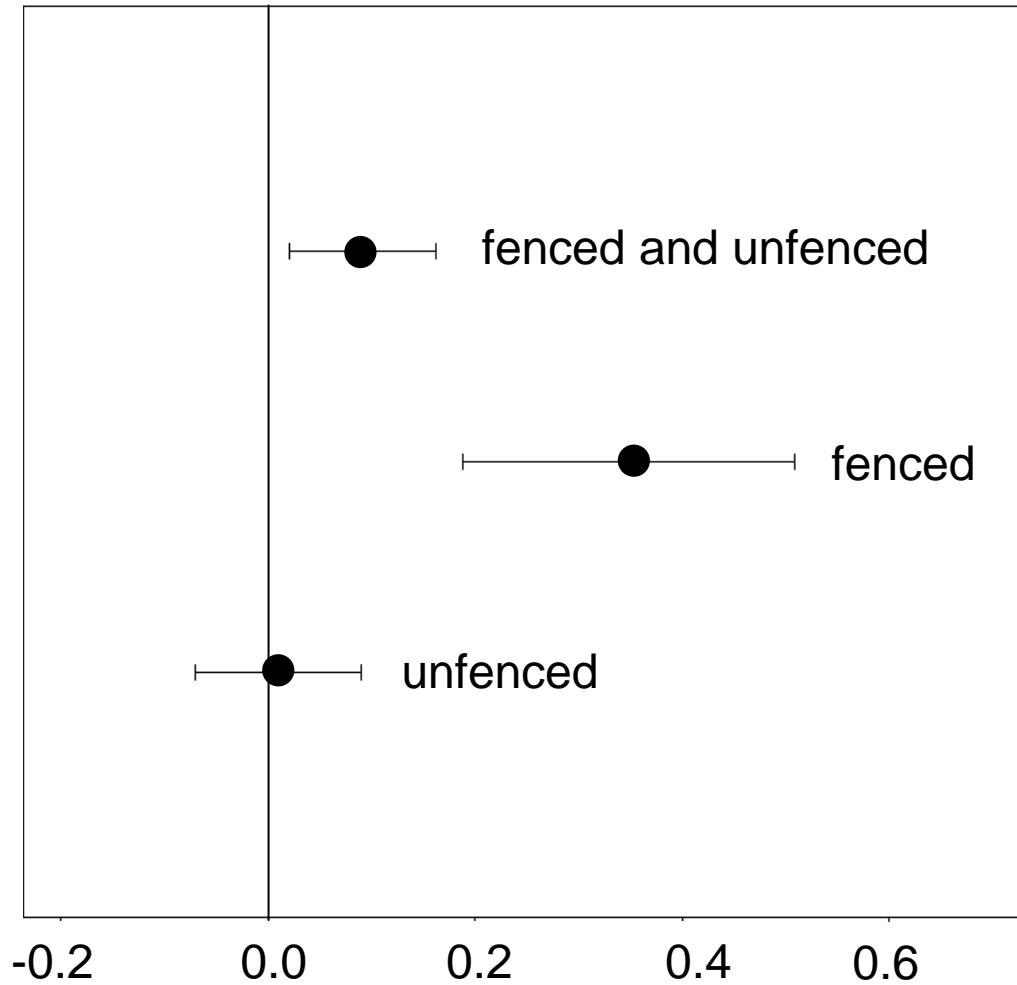

Combining biodiversity data: meta-analysis

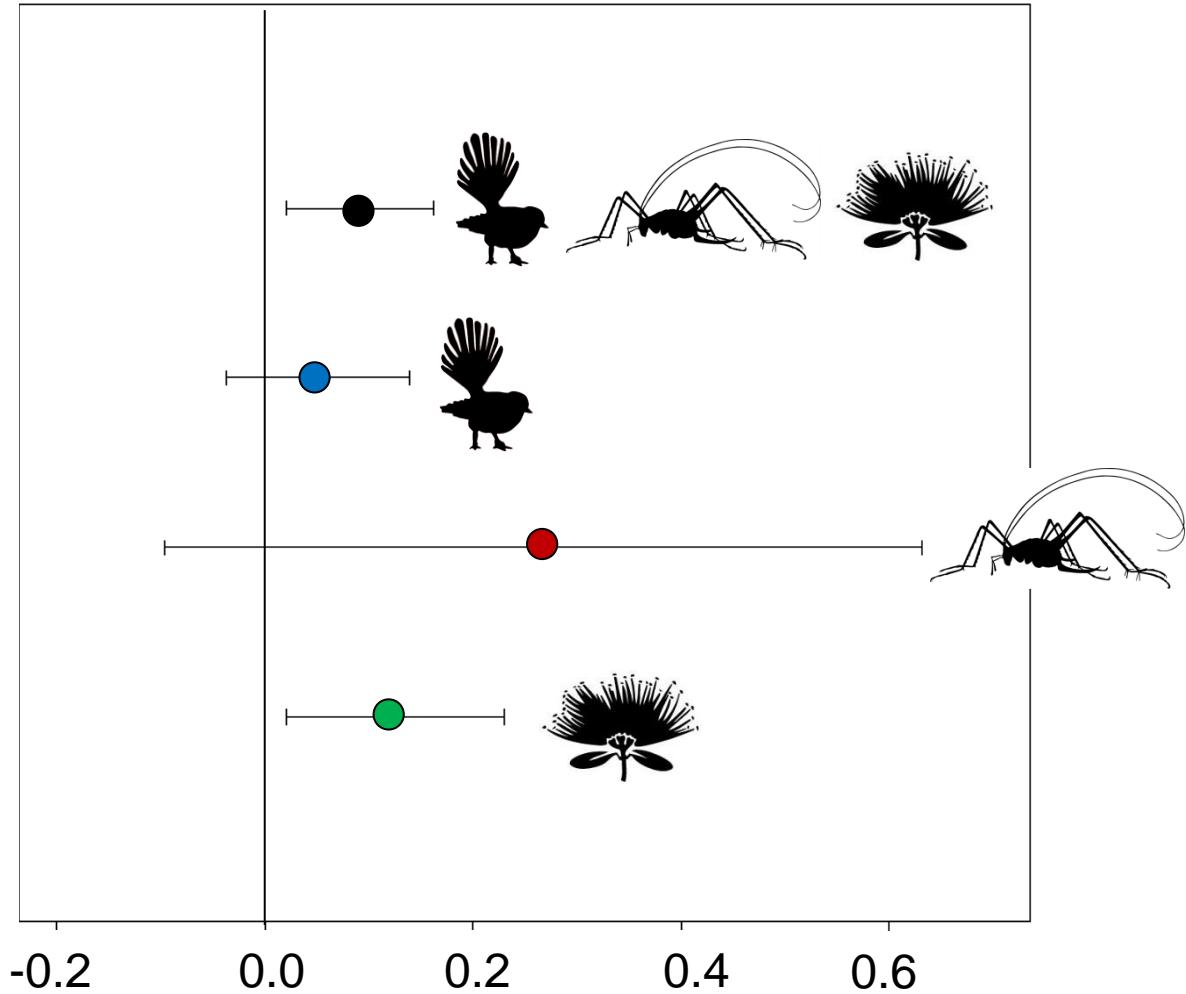

“Effect size”: measures the effect on a native population of conducting pest control, relative to the effect of not conducting pest control.

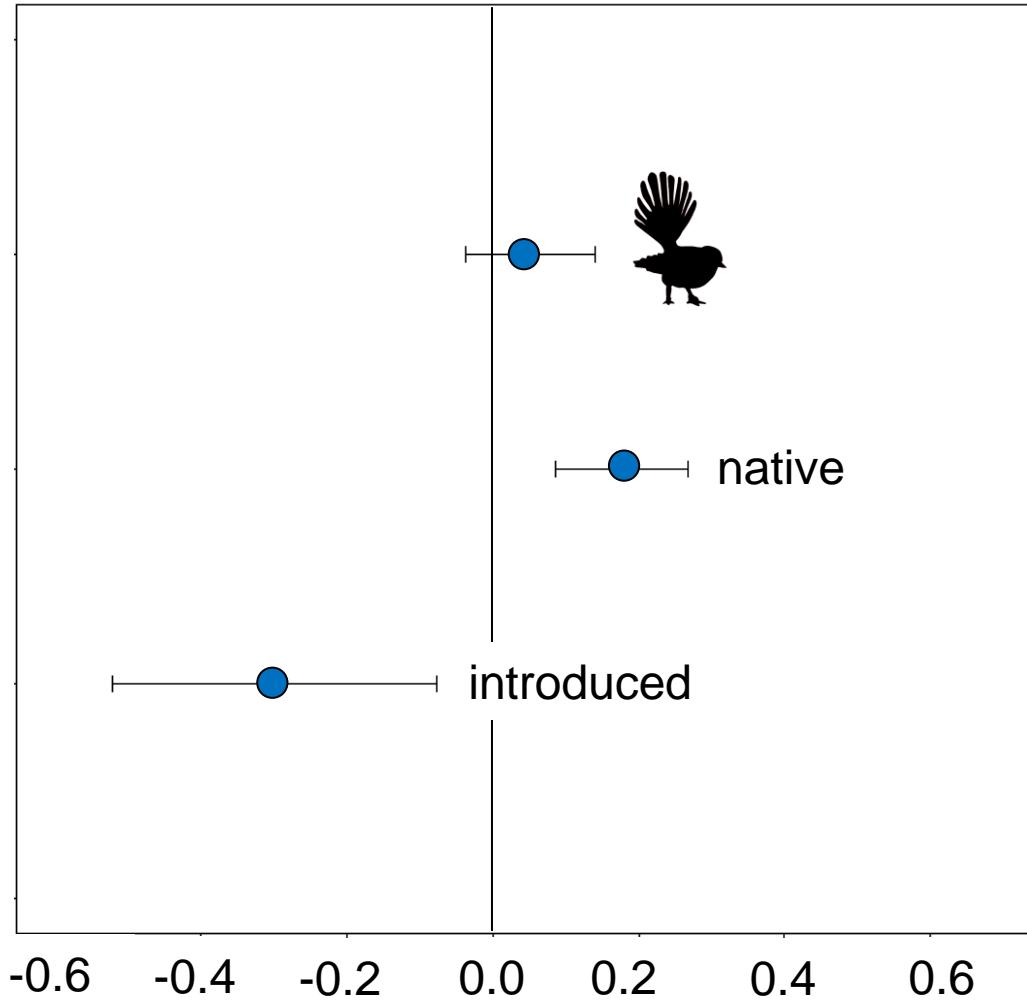

Major control regimes

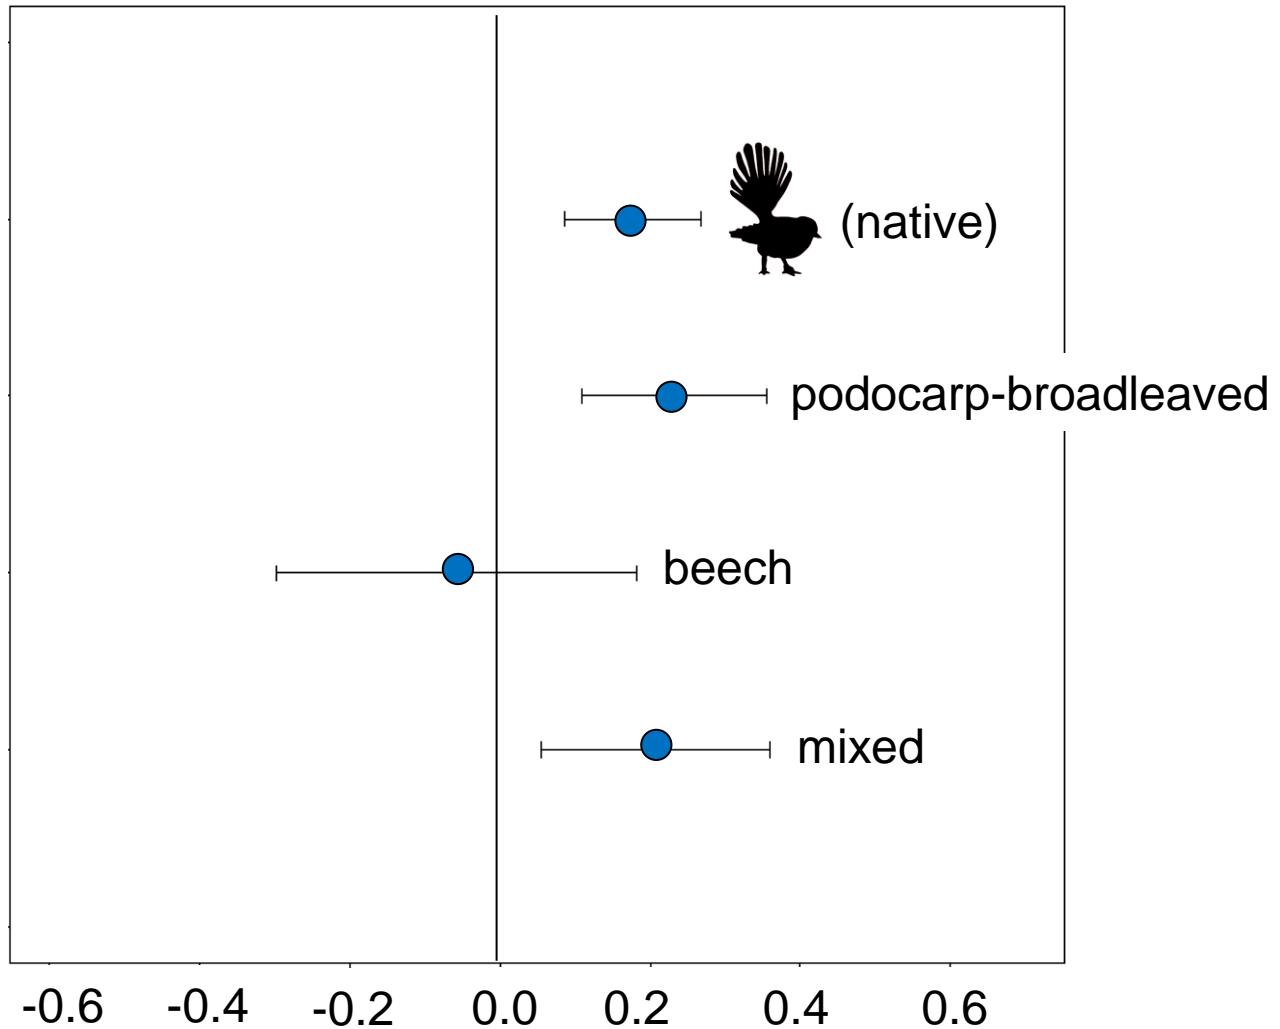

Taxonomic groups

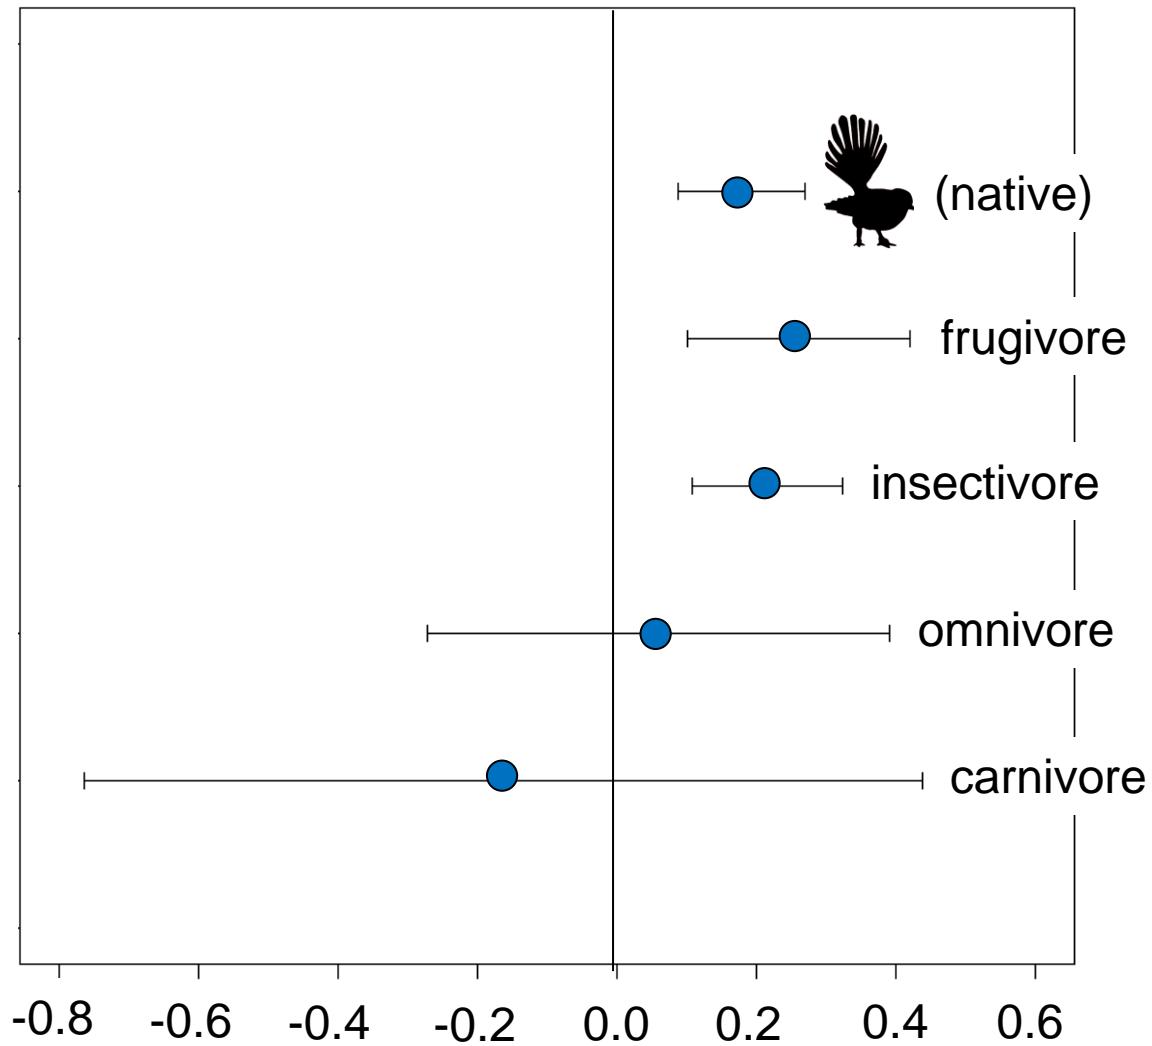

Bird endemicity

Habitat for native birds

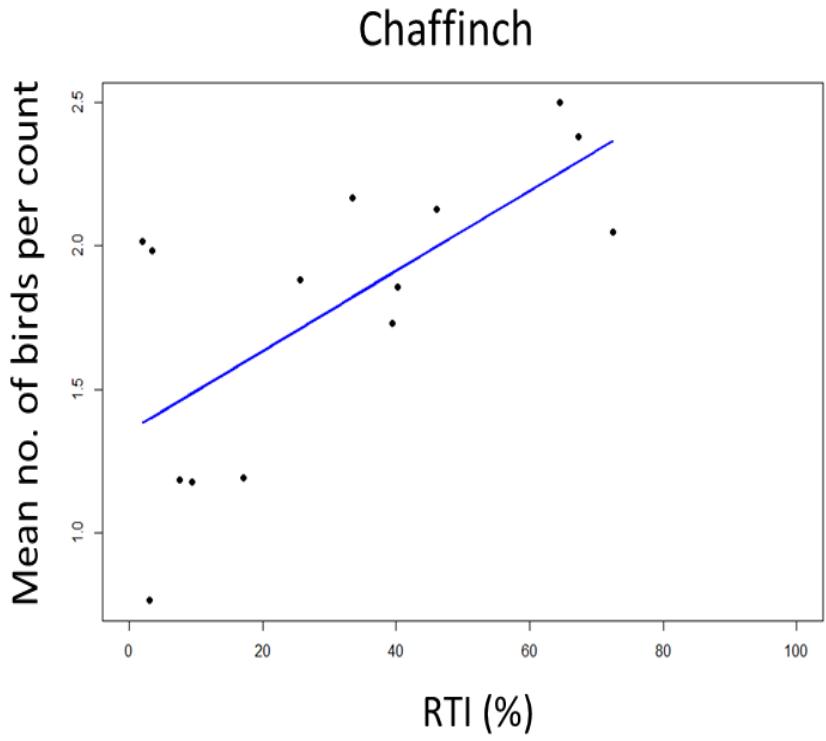

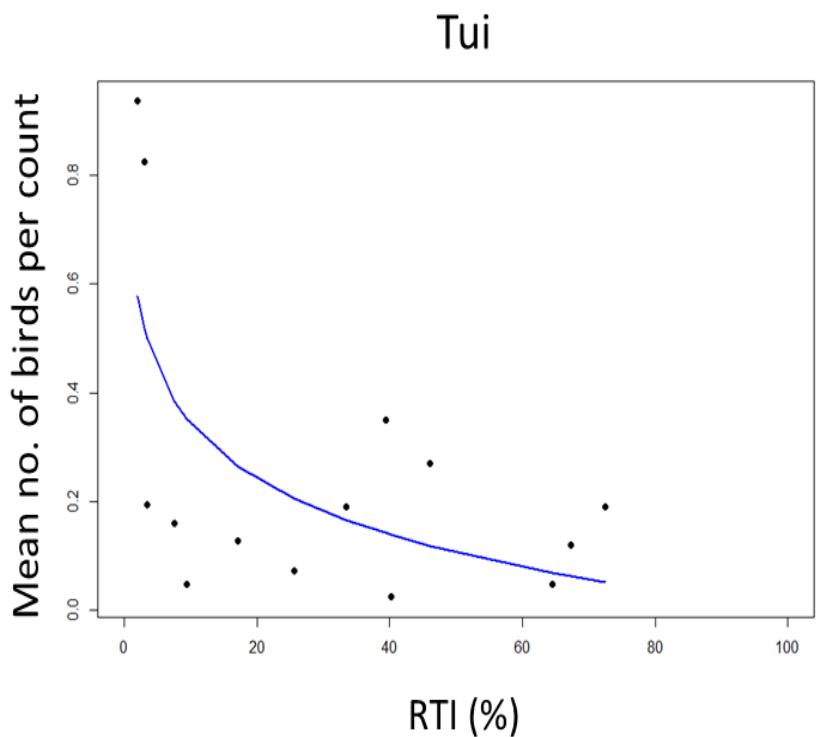

Primary guild for native birds

Future work

- Density-impact functions

Future work

- Compare community-level responses across different regimes by fitting a multi-species, multi-site hierarchical Bayesian model
- Aggregating large and heterogeneous data sets: challenges and recommendations
